ABSTRACT

A method for controlling menstrual flow including sphincterally contracting and expanding labia minora having left and right labium minuses, such anatomical structures moving to a closed position upon each sphincteral contraction or to an opened position upon each sphincteral expansion; adhering and disjoining the labia minora, each adhesion securing the labia minora at the closed position, the disjunctions freeing the labia minora for opening movement; and resisting and permitting menstrual flow, the resistance occurring on sphincteral contraction and adhesion, and the permission occurring upon sphincteral expansion, each adhering step disposing a hydrophobic and bio-compatible adhesive selected from acrylic adhesives, polyisobutylene adhesives, and silicone adhesives, and each disposition step utilizing an applicator selected from brushes, swabs, rub-on sticks, roll-on applicators, pump sprayers, aerosol sprayers, squeeze tube applicators, bottle applicators, and finger applicators.
